Where the unreported pathogens are: Europe

642 of the 928 mapped wheat libraries, at 258 of 384 localities.
Grey points are every sampled locality; coloured points are detections in studies that did not report the species.

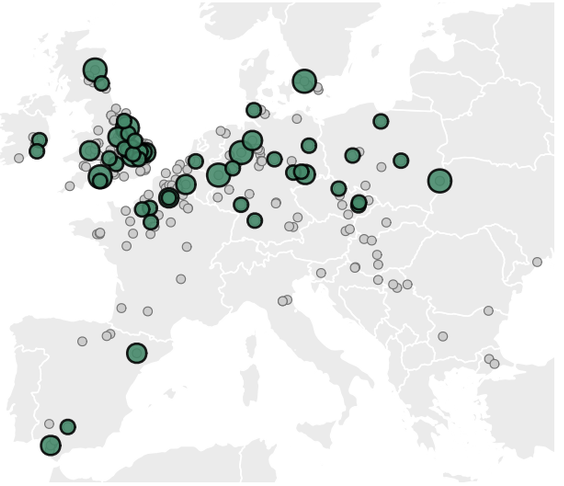

Zymoseptoria tritici
septoria tritici blotch
248 of 642 libraries (38.6%)

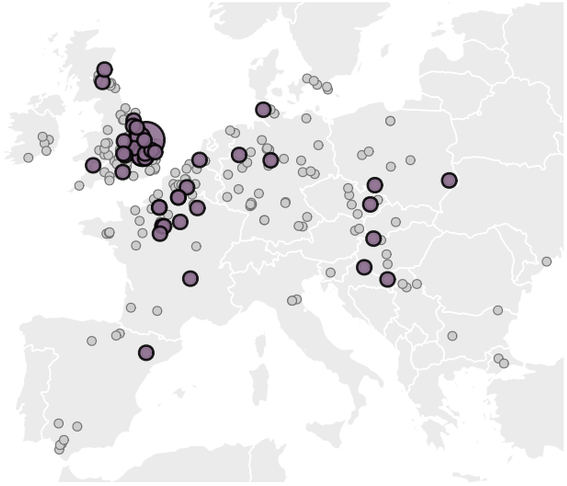

Puccinia triticina
brown rust
103 of 604 libraries (17.0%)

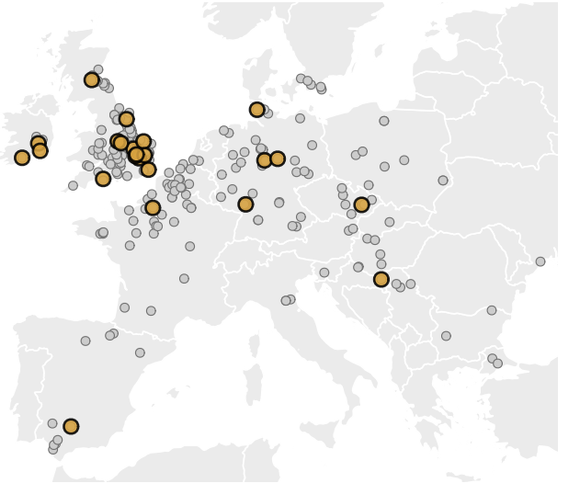

Blumeria graminis
powdery mildew
81 of 642 libraries (12.6%)

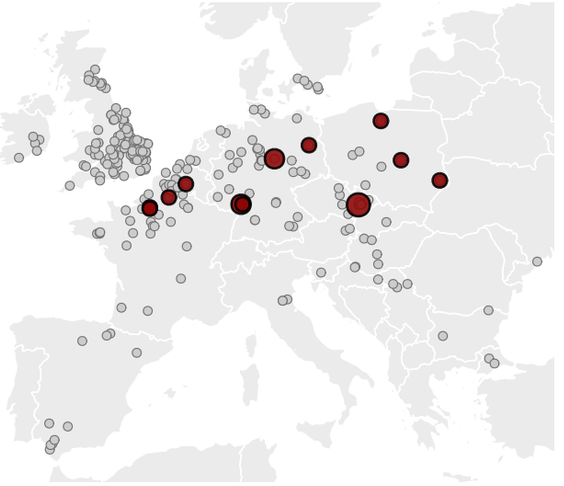

Microdochium nivale
snow mould
53 of 642 libraries (8.3%)

Parastagonospora nodorum
septoria nodorum blotch
23 of 642 libraries (3.6%)

Pyrenophora tritici-repentis
tan spot
16 of 642 libraries (2.5%)

libraries with the species detected

1 3 6

The rate in each panel heading is the measured quantity: point density follows sampling effort, so the map shows where a species occurs, not how often.
All libraries were collected from visibly diseased plants, so these are not prevalence surfaces.
